3. Does It Work? (Gate 3)

What we tested

300 fake planner requests the model never saw during training:

- **Familiar (150):** written in the same styles as the training data.
- **Unfamiliar (150):** new wording, slang and typos, like “vow renewal”, “Tulum-ish”, “beamer”, “rounds of ten”. **This is the honest test.**

A request counts as **right** only if the event type, guests and budget are correct, a good space is in the top 3, and nothing suggested breaks a requirement.

Results (measured November 7, 2026)

Who reads the request	Familiar wording	Unfamiliar wording
Keyword search (how normal search works)	19.3% right	0% right
Our BreezeBook model	**99.3% right**	**8% right** (good space in top 3: 49.3%)
Claude	–	___% (press “Run Claude” in the Accuracy lab)
Auto: our model, Claude when unsure	–	___% (same button)

What this means, simply

- On wording it has seen, our model is almost perfect, and much better than keyword search.
- On new wording, it falls apart: it gets the event type right only 29% of the time and the style only 15%. **A model trained only on fake data can’t learn words it has never seen.**
- Guests, budget and dates were read correctly 100% of the time on both sets. *Caveat: we wrote those reading rules knowing what the test wording looked like, so this number is optimistic.*

Our model knows when it’s unsure

Confidence needed	Familiar: handled by our model	Unfamiliar: handled by our model
80%	96% (and 99.3% of those are right)	only 2%; the other 98% go to Claude

That’s why Auto mode works: our free model handles what it knows and asks Claude about the rest.

What we tried to improve it

Change	Unfamiliar: right	Unfamiliar: good space in top 3
Version 1: word patterns	4%	42.7%
Version 2: + letter patterns (helps with typos)	7.3%	44.7%
Version 3: + 600 requests in a third writing style	6–8%	49.3%

Top 3 failure types

1. **New event words:** “vow renewal” read as birthday; “annual convention” read as party.
2. **New style words:** “Tulum-ish”, “fairytale” and “Gatsby” weren’t recognized at all.
3. **Indoor or outdoor:** “al fresco” and “AC inside” weren’t understood.

Cost per successful result

- **Our model:** $0, because it runs in the browser.
- **Claude:** about $0.00025 per request. Cost per successful result = total Claude cost ÷ requests it got right. Fill this in after the Claude run.
